

Are Highly Permeable Membranes Too Permeable?

VaproShield®, an industry leader in advanced building envelope solutions, is pleased to release *Are Highly Permeable Membranes Too Permeable?*, an AIA accredited technical seminar. This live presentation investigates the **current research on vapor open systems and discusses how more permeability enhances wall assembly performance.**

Your training will be presented using online meeting software. Instructions for accessing your online course will be sent from your host.

We will examine:

- Water vapor transmittance
- Water hold out vs. air tight
- Drying capacity
- Vapor barriers vs. vapor open
- The perfect wall; cladding and rainscreen

Learning Objectives

- Define what permeance is and how it is tested
- Understand wall assembly drying mechanisms
- Show the benefits of permeable assemblies
- Illustrate the differences between vapor tight and highly permeable WRB membranes in relation to water intrusion of a wall assembly

Contact your local representative or visit VaproShield.com to schedule your AIA Live accredited Technical Seminar.
